

**COSC 24L3: Lab Assignment #9**  
**Computer Science Department @ Dallas Baptist University**  
**Fall 2023**

Define classes for clients who are different types of Employees: **SalariedEmployee**, **HourlyEmployee**, and **CommissionEmployee** as shown in the following class diagram. Define a base class **Employee** for these three classes. Define a default constructor and a parameterized constructor with all the attributes as the parameters for each class. Define get and set methods. The **earnings()** method returns the earnings of the employee and **print()** method displays employee's information including name, ssn, and salary. The **earnings()** and **print()** are abstract methods in Employee class.

SalariedEmployee: earnings = weekly salary

HourlyEmployee: if hours <= 40 earnings = wage \* hours;  
if hours > 40 earnings = (40\*wage) + ((hours - 40) \* wage \* 1.5)

CommissionEmployee: earnings = commissionRate \* grossSales

Use attached driver program (**EmployeeTest.java**) to test your classes.

Sample run:

Name: John Smith  
Ssn: 123456789  
Salary: \$250.67

Name: Mary Jones  
Ssn: 987654321  
Wage: \$11.2  
Hours: 15  
Salary: \$168.0

Name: James Bond  
Ssn: 007  
Commission rate: 0.12  
Sale total: \$120000.0  
Salary: \$14400.0
